

TC018 Security - Payload Injection

Work Item ID: 1572

Description: Verify boundary protection layers block unauthorized payload parameter modification

Precondition: Malicious gateway node targeted.

Test Step: 1

Test Step Description: Attempt to pass claim with manually altered deductible balance injection headers.

Test Step Expected Result: Security validation gateway detects string parameter mutation, halts processing, maps status to 'BLOCKED', and generates a high-severity security log tracking token.

TC002 Anomaly Detection Alert

Work Item ID: 1573

Description: Verify alert generation SLA when a product metric deviates from historical distribution

Precondition: Pre-trained predictive model cores are fully operational.

Test Step: 1

Test Step Description: Inject anomalous sample data stream into active processing queue paths.

Test Step Expected Result: AI processing layer intercepts structural boundary exception and sends a system alert UI notification within 2 seconds.

TC005 Successful Insights Display

Work Item ID: 1573

Description: Verify top 5 prioritized AI-generated insights display within 5 seconds of loading

Precondition: Valid product analytics data dashboard dataset is refreshed and available.

Test Step: 1

Test Step Description: Trigger dashboard page refresh load.

Test Step Expected Result: AI engine evaluates metrics and displays top 5 prioritized trends, anomalies, and recommended actions within 5 seconds.

TC008 Edge - Borderline Deviation Limit

Work Item ID: 1573

Description: Verify anomaly classification threshold criteria right at model mathematical limits

Precondition: Model boundary trigger point set precisely to 3.0 standard deviations.

Test Step: 1

Test Step Description: Transmit precise edge metric adjustment dataset row items.

Test Step Expected Result: System correctly isolates border fluctuation as an active deviation anomaly, outputting accurate diagnostic reporting values.
